

SPECIAL PLATINGS AND COATINGS

Platings and coatings are rarely necessary with our crimper and sealing jaw base materials, but numerous options are available when required.

Surface Protection Coatings serve primarily to protect a part from corrosion. The most common is electroless nickel plating.

Surface Enhancement Coatings are designed to improve the functional performance of the part. With crimpers and sealing jaws this often means increasing hardness to improve durability and/or reducing surface friction to eliminate sticking problems.

Whenever necessary, we can recommend and provide the proper plating or coating for your application.
