

SEAL REDUCTION PROFILE

- Realize significant savings by decreasing film usage.
- Crimpers and Sealing Jaws with Greener's Seal Reduction Profile enable the use of a smaller seal area on each package without sacrificing seal strength or integrity.
- The size, shape and placement of the serrations on the sealing face are designed to optimize shear and concentrate pressure.
- The Seal Reduction Profile decreases film usage by allowing for a reduced package length without changing headspace.
- Available for both horizontal FFS flow wrappers and vertical FFS baggers.
- Available in both standard and Easy Seal configurations.

The following example provides an illustration of the possible savings:

A customer was running 6" long packages on a horizontal flow wrapper. The full seal width (crimp and cut) on each end of the package was 12mm (0.472"). We reduced the width of the sealing face on the crimpers, changed the serration design and reduced the thickness of the knife. The resulting package required 9mm (0.35") less material, and film costs were reduced by over 5%.
