

TEAR NOTCH

A tear notch makes packages produced on vertical form/fill/seal baggers easier to open. This small slit in the end seal allows consumers to easily tear the film in order to gain access to the product.

The slit is produced by a carbide notch punch that is affixed in the sealing face of the jaw. The carbide material provides exceptional durability, and the jaw mounted design provides significant cost benefits when compared to notch punches that are attached to the machine knife.

The tear notch can be located wherever desired on the end seal of the bag, and can be integrated with a tear strip feature or “Open Here” graphics.
