SEAL REDUCTION PROFILE

- Realize significant savings by decreasing film usage.
- Sealing Jaws with Greener's Seal Reduction Profile reduce seal area on each package without sacrificing seal integrity or machine speeds.
- The advanced sealing jaw serration geometry distributes a machine's force more effectively to widen the seal range with traditional and sustainable materials.
- The Seal Reduction Profile decreases film usage by reducing package length without changing head space.
- Available for both horizontal FFS flow wrappers and vertical FFS baggers.
- Available for standard, **Easy Seal™** and patented **XR™** sealing jaws.

The following example provides an illustration of the possible savings:

A customer was running 6" long packages on a horizontal flow wrapper. The full seal width (crimp and cut) on each end of the package was 12mm (0.472"). We reduced the width of the sealing face on the crimpers, changed the serration design and reduced the thickness of the knife. The resulting package required 9mm (0.35") less material, and film costs were reduced by over 5%.
